

BEFORE WE GET STARTED

In the early planning stages, it's important that we consider all of the project details that may affect the barrier layout. We want to ensure that by planning ahead, your Zoneguard installation goes as smooth as possible and any last minute glitches are avoided. Please help us by reviewing the items on this checklist and contact us if further information or coordination is needed.

#1 What kind of anchor and anchoring configuration (Standard or Minimum Deflection System) is being employed?

- Would you anchor concrete barrier?
- What kind of road surface (i.e. asphalt, concrete or bridge-mounted)?

#2 What about impact attenuators/crash cushions/end treatments?

- What model of attenuator do you plan to use?
- Is the direction of traffic unidirectional or bidirectional?

#3 Will you need shorter sections, other than standard 50' units?

- Are there any curves or tight radiuses?
- Are there strict parameters regarding length of barrier run?

#4 Are expansion units required and/or necessary?

#5 Are there any space constrictions that may affect barrier installation?
